Cover Letter

Round 2 Revision

Manuscript: "Content-Conditioned Invariant Feature-Statistic Augmentation: Unifying Robustness and Weight Averaging for Domain Generalization" (CIFA)
Journal: *Electronics* (MDPI) **Manuscript ID:** electronics-4654208
Date: 3 November 2026

Dear Editor,

We thank you and the reviewers for the careful second-round assessment. We have addressed every comment point by point, and on the Round 2 revision submission page we have separately submitted a point-to-point cover letter to each of the three reviewers. No new training experiments were required; the revisions concern presentation, mathematical justification, wording and internal consistency.

The substantive changes are summarised as follows:

- **Figures.** All seven figures were redrawn as publication-ready vector files, with legends moved outside the plotting areas and enlarged fonts, markers, line widths and cap sizes. Every data point and reported number is unchanged.
- **Theoretical clarification.** Proposition 1 is now stated in three layers: the exact case, unconditional distribution-level total-variation bounds, and a pointwise posterior bound that holds only under an explicit inter-model likelihood-ratio condition, under which the bound is $\mathrm{TV} \leq \tanh(\alpha)$; the KL corollary is conditioned on the same assumption.
- **Statistical wording.** We consistently distinguish a non-significant difference (statistically tied / on par), equivalence certified by a TOST with a stated margin using the correct 90% confidence interval, and superiority. We make no superiority claim, and the effectiveness boundary is characterised empirically rather than as a guaranteed improvement.
- **Editorial cleanup.** The duplicated data-availability statement was removed, followed by a full consistency check of equations, tables, cross-references and terminology.

We confirm that this manuscript is original, has not been published elsewhere, and is not under consideration by any other journal. All authors have approved the revised version and the author list is unchanged. The authors declare no conflict of interest. All references are necessary and are substantively cited within the manuscript, with none included merely to inflate the bibliography. All data and the reproducible code are publicly available at https://github.com/qsongcai/CIFA.

We hope the revised manuscript now meets the requirements and remain at your disposal should any further adjustments be needed.

Sincerely,

Qingsong Cai
