
(a) coverage gap η: zero inside the hull, positive outside
target outside hull
η > 0 (target-dependent)
target inside hull
η = 0
dashed circle = full augmentation family
polygon = empirical hull of source operators
(b) source-side h_s is estimable and → 0
zoom: s = 3–10
h_s (source-side hull gap)
number of realized operators s
10th–90th percentile
mean h_s
